## The role of ultra-processed food consumption and depression on type 2 diabetes incidence: a prospective community study in Quebec, Canada

Akankasha Sen<sup>1,2</sup>, Anne-Sophie Brazeau<sup>1</sup>, Sonya Deschênes<sup>3</sup>,  
Hugo Ramiro Melgar-Quiñonez<sup>1</sup> and Norbert Schmitz<sup>2,4,5,\*</sup>

<sup>1</sup>School of Human Nutrition, McGill University, Sainte-Anne-de-Bellevue, QC, Canada: <sup>2</sup>Douglas Mental Health University Institute, Bd LaSalle, QC, Canada: <sup>3</sup>UCD School of Psychology, University College Dublin, Belfield, Dublin, Ireland: <sup>4</sup>Department of Psychiatry, McGill University, West Montreal, QC, Canada: <sup>5</sup>Department of Population-Based Medicine, Tuebingen University, Hoppe-Seyler-Street 9, Tuebingen 72076, Germany

To prospectively investigate the potential additive interaction between ultra processed food consumption and depression on the incidence of T2D in a Canadian community sample

## Baseline data

- CARTaGENE health survey study
- Population-based, prospective cohort health study of Quebec residents
- Genetic, lifestyle, and environmental determinants of disease progression

participants

20 000

aged 40-69

4 Regions

### Phase A

~ 20,000 participants  
(2009-2010)

Metropolitan areas

Montréal, Québec  
Sherbrooke, Saguenay

Sampling frame

FIPA\*\*

Collected data

Physical measures	✓
Health questionnaire	✓
Genealogy questionnaire***	✓
Food frequency questionnaire	✓
Residential and occupational questionnaire	✓

Biological samples

Blood	✓
Urine	✓

\* Follow-ups are done annually using a web-based portal

\*\* Fichier d'inscription des personnes assurées (list of individuals covered)

\*\*\* In collaboration with BALSAC (UQAC)

CARTaGENE: Health survey (Baseline)

RAMQ: Administrative health database (Follow-up)

# Measures

**Depression** : Defined either using a score of 6 and higher on the Patient Health Questionnaire-9 (PHQ-9) or antidepressant use

## PATIENT HEALTH QUESTIONNAIRE-9 (PHQ-9)

Over the last 2 weeks, how often have you been bothered by any of the following problems?  
(Use "✓" to indicate your answer)

	Not at all	Several days	More than half the days	Nearly every day
1. Little interest or pleasure in doing things	0	1	2	3
2. Feeling down, depressed, or hopeless	0	1	2	3
3. Trouble falling or staying asleep, or sleeping too much	0	1	2	3
4. Feeling tired or having little energy	0	1	2	3
5. Poor appetite or overeating	0	1	2	3
6. Feeling bad about yourself — or that you are a failure or have let yourself or your family down	0	1	2	3
7. Trouble concentrating on things, such as reading the newspaper or watching television	0	1	2	3
8. Moving or speaking so slowly that other people could have noticed? Or the opposite — being so fidgety or restless that you have been moving around a lot more than usual	0	1	2	3
9. Thoughts that you would be better off dead or of hurting yourself in some way	0	1	2	3

FOR OFFICE CODING 0 + \_\_\_\_\_ + \_\_\_\_\_ + \_\_\_\_\_  
=Total Score: \_\_\_\_\_

If you checked off any problems, how difficult have these problems made it for you to do your work, take care of things at home, or get along with other people?

Not difficult at all

Somewhat difficult

Very difficult

Extremely difficult

# Measures

## **Dietary assessment:** Canadian Diet History Questionnaire II (C DHQ-II)

- 165 questions related to food, portion size, frequency, and nutritional supplement use during the last 12 months
- DHQ II recorded a typical Canadian portion size for each item
- Consumption frequencies were measured into ten categories ranging from: 1-6 times per year to 2 or more times per day
- Daily consumption of each items was calculated
- Portions of consumed food items were converted into grams by using the nutrient database for the C-DHQII
- Consumed amount for every food item: Frequency per day  $\times$  Grams of consumption
- NOVA classification

# NOVA classification

- Extent and purpose of food processing
- First proposed by a team of investigators at the University of São Paulo led by Prof Carlos Monteiro in 2009
- Canada, the United States, Europe, and many Latin American

# NOVA classification system

Unprocessed  
or minimally  
processed  
foods

Processed  
culinary  
ingredients

Processed  
foods

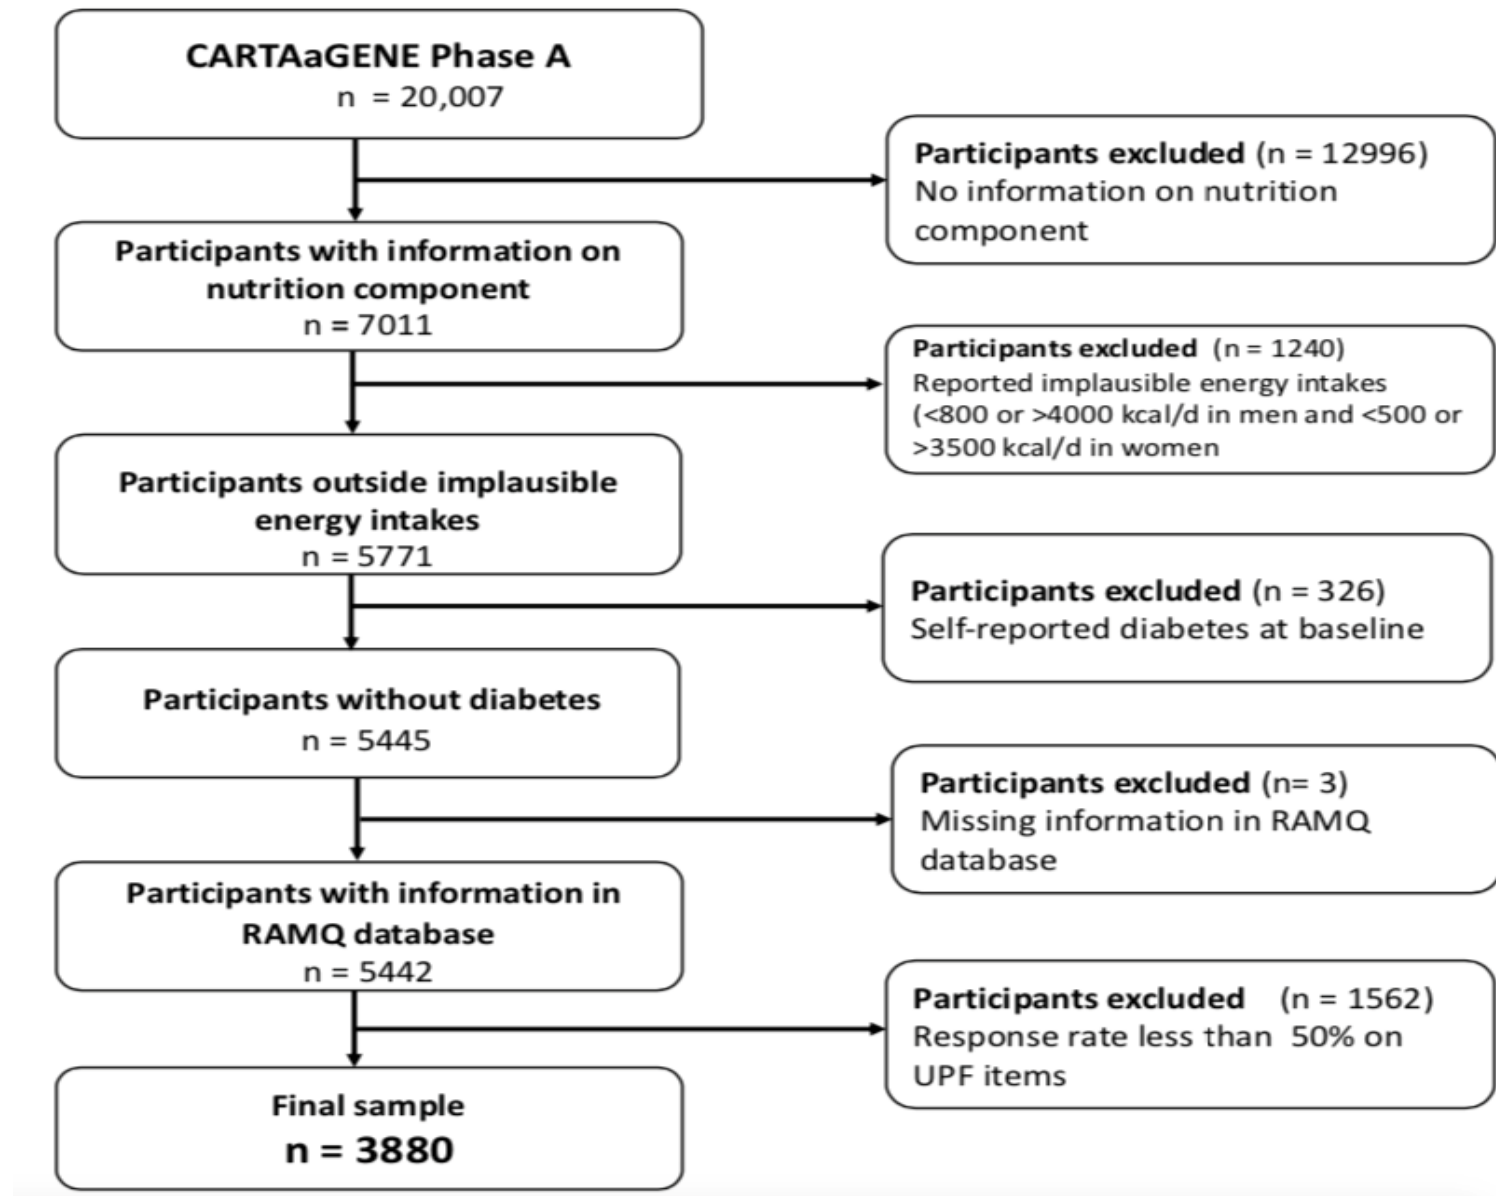

Ultra-  
processed  
foods

# NOVA classification system

## Four-Stage Identification Process

# Inclusion and exclusion criteria

**Fig. 1** Flow diagram of the final sample for the analysis. RAMQ, Régie de l'Assurance Maladie du Québec; UPF, ultra-processed foods

# Cox proportional hazards

Exposure

- a) Lower/middle tertile of UPF and low depressive symptoms (LUND as the reference group)
- b) Lower/middle tertile of UPF and high depressive symptoms (LUD)
- c) Higher tertile of UPF and low depressive symptoms (HUND)
- d) Higher tertile of UPF and high depressive symptoms (HUD)

CARTaGENE  
Baseline (2009-2010)

7 year of follow-up

Outcome

Incidence of  
T2D  
Hazard ratios and  
95% confidence  
intervals

RAMQ  
Administrative health database  
2016

Survival analyses was be performed in unadjusted models and models adjusted for covariates

# Cox proportional hazards

Exposure

- a) Lower/middle tertile of UPF and low depressive symptoms and no antidepressant use (LUNDA as the reference group)
- b) Lower/middle tertile of UPF and high depressive symptoms or antidepressant use (LUDA)
- c) Higher tertile of UPF and low depressive symptoms and no antidepressant use (HUNDA)
- d) Higher tertile of UPF and high depressive symptoms or antidepressant use (HUDA)

CARTaGENE

Baseline (2009-2010)

7 year of follow-up

Outcome

Incidence of  
T2D  
Hazard ratios and  
95% confidence  
intervals

RAMQ

Administrative health database  
2016

Survival analyses was be performed in unadjusted models and models adjusted for covariates

## Baseline characteristics of the study sample

- The sample was on average 54.2 years old
- Participants in the higher tertile of UPF and high depressive symptoms group (HUD) had a higher mean intake of UPF: 605 (711.5) g/d
- A total of 263 (6.8 %) individuals developed T2D during the observation period

Contribution of each food group to total amount of ultra-processed foods consumed in the CARTaGENE study cohort

Food groups ( <i>n</i> 37)	Contribution to total ultra-processed foods intake (%)*	Daily amount consumed mean g/d	SD
<b>Beverages (<i>n</i> 7)</b>			
Dairy beverages	5.3	11.8	38.3
Soft/isotonic drinks	44.0	99.3	294.6
Fruit drinks	4.5	10.2	87.4
<b>Solid foods (<i>n</i> 30)</b>			
Processed meat	4.5	10.2	15.2
Fast food and ready to eat	11.2	25.4	27.9
Breakfast cereals	4.5	10.1	14.5
Cookies, biscuits, muffins and cake	11.7	26.5	37.7
Potato chips and salty snacks	3.4	7.6	10.5
Confectionery and chocolate	2.8	6.3	15.3
Ketchup, salad dressing and similar	4.5	10.2	12.3
Ice-cream	2.3	5.2	10.6
Jelly and jams products	1.4	3.1	6.1
<b>Total</b>	<b>100</b>	<b>225.8</b>	<b>331.8</b>

\*Contribution (%) of each food group/beverage to the total consumption of ultra-processed food was calculated by dividing the amount (g/d) of each food group by the total amount of ultra-processed foods (g/d) multiplied by 100.

Results of Cox regression for UPFs consumption and depression assessed using PHQ9 and anti-depressant for incident type 2 diabetes

Groups	N	Fully Adjusted Model, HR (95% CI) *
<b>Model 1: UPFs consumption univariate association</b>		
Lower tertile Of UPFs consumption	1293	Reference
Middle tertile Of UPFs consumption	1294	1.26 (0.91. -1.74)
Higher tertile Of UPFs consumption	1293	1.47 (1.07-2.03)
<b>Model 2: Depression univariate association</b>		
PHQ-9 summary score (< 6) Low	3441	Reference
PHQ-9 summary score (>= 6) High	439	1.22 (0.85-1.76)
<b>Model 3: Anti-depressant use univariate association</b>		
Anti-depressant use NO	3599	Reference
Anti-depressant use YES	281	1.32 (0.85-2.01)

UPFs, Ultra-processed foods; PHQ-9, Patient Health Questionnaire-9.

\*Fully adjusted model is adjusted for the following variables: age, sex, household income, education, ethnicity, born in Canada, smoking status, physical activity, daily alcohol consumption.

Results of Cox regression for UPF consumption and depression assessed using PHQ-9 and anti-depressant joint association for incident type 2 diabetes

<b>Model 1 UPFs consumption lower &amp; middle tertile combined and depressive symptoms joint association</b>				
<b>Groups</b>	<b>N</b>	<b>Incident T2D (N)</b>	<b>Fully Adjusted Model, HR (95% CI)</b>	
LUND	2327	138	Reference	
LUD	260	18	1.21 (0.73-1.98)	
HUND	1114	91	1.28 (0.97 -1.69)	
HUD	179	16	1.58 (0.93 - 2.68)	

LUND, lower/middle tertile of ultra-processed foods consumption and low depressive symptoms; LUD, lower/middle tertile of ultra-processed foods consumption and high depressive symptoms; HUND, higher tertile of ultra-processed foods consumption and low depressive symptoms; HUD, higher tertile of ultra-processed foods consumption and high depressive symptoms

Fully adjusted model is adjusted for the following variables: age, sex, household income, education, ethnicity, born in Canada, smoking status, physical activity, daily alcohol consumption

Results of Cox regression for UPF consumption and depression assessed using PHQ-9 and anti-depressant joint association for incident type 2 diabetes

<b>Model 2 UPFs consumption lower &amp; middle tertile combined and depressive symptoms/Antidepressant use joint association</b>				
<b>Groups</b>	<b>N</b>	<b>Incident T2D (N)</b>	<b>Fully Adjusted Model, HR (95% CI)</b>	
LUNDA	2207	127	Reference	
LUDA	380	29	1.38 (0.92 -2.07)	
HUNDA	1046	85	1.31 (0.98-1.74)	
HUDA	247	22	1.62 (1.02 -2.57)	

LUNDA, lower and middle tertile of ultra-processed foods consumption and low depressive symptoms and no antidepressant use; LUDA, lower and middle tertile of ultra-processed foods consumption and high depressive symptoms or antidepressant use; HUNDA, higher tertile of ultra-processed foods consumption and low depressive symptoms and no antidepressant; HUDA, higher tertile of ultra-processed foods consumption and high depressive symptoms or antidepressant.

\*Fully adjusted model is adjusted for the following variables: age, sex, household income, education, ethnicity, born in Canada, smoking status, physical activity, daily alcohol consumption

# STUDY TWO

## **Ultra-processed foods consumption, depression, and the risk of diabetes complications in the CARTaGENE project: A prospective cohort study in Quebec, Canada**

Akankasha Sen, Anne-Sophie Brazeau, Sonya Deschênes, Hugo Ramiro Melgar-Quiñonez, Norbert Schmitz

To investigate a potential additive interaction between ultra processed food consumption and depressive symptoms on the incidence of diabetes-related complications in adults with T2D

CARTaGENE: Health survey (Baseline)

RAMQ: Administrative health database (Follow-up)

## Study 1

- Participants without diabetes
- More female (60%) than male

## Study 2

- Participants with diabetes
- Proportion of male and female were same

# Measures

**Depression** : Defined either using a score of 6 and higher on the Patient Health Questionnaire-9 (PHQ-9) or antidepressant use

**Dietary assessment:** Canadian Diet History Questionnaire II (C-DHQ-II)

- Daily consumption of each item was calculated
- Portions of consumed food items were converted into grams by using the nutrient database for the C-DHQII
- Consumed amount for every food item: Frequency per day  $\times$  Grams of consumption
- NOVA classification

# Measures

**Outcome:** Microvascular diabetes complications

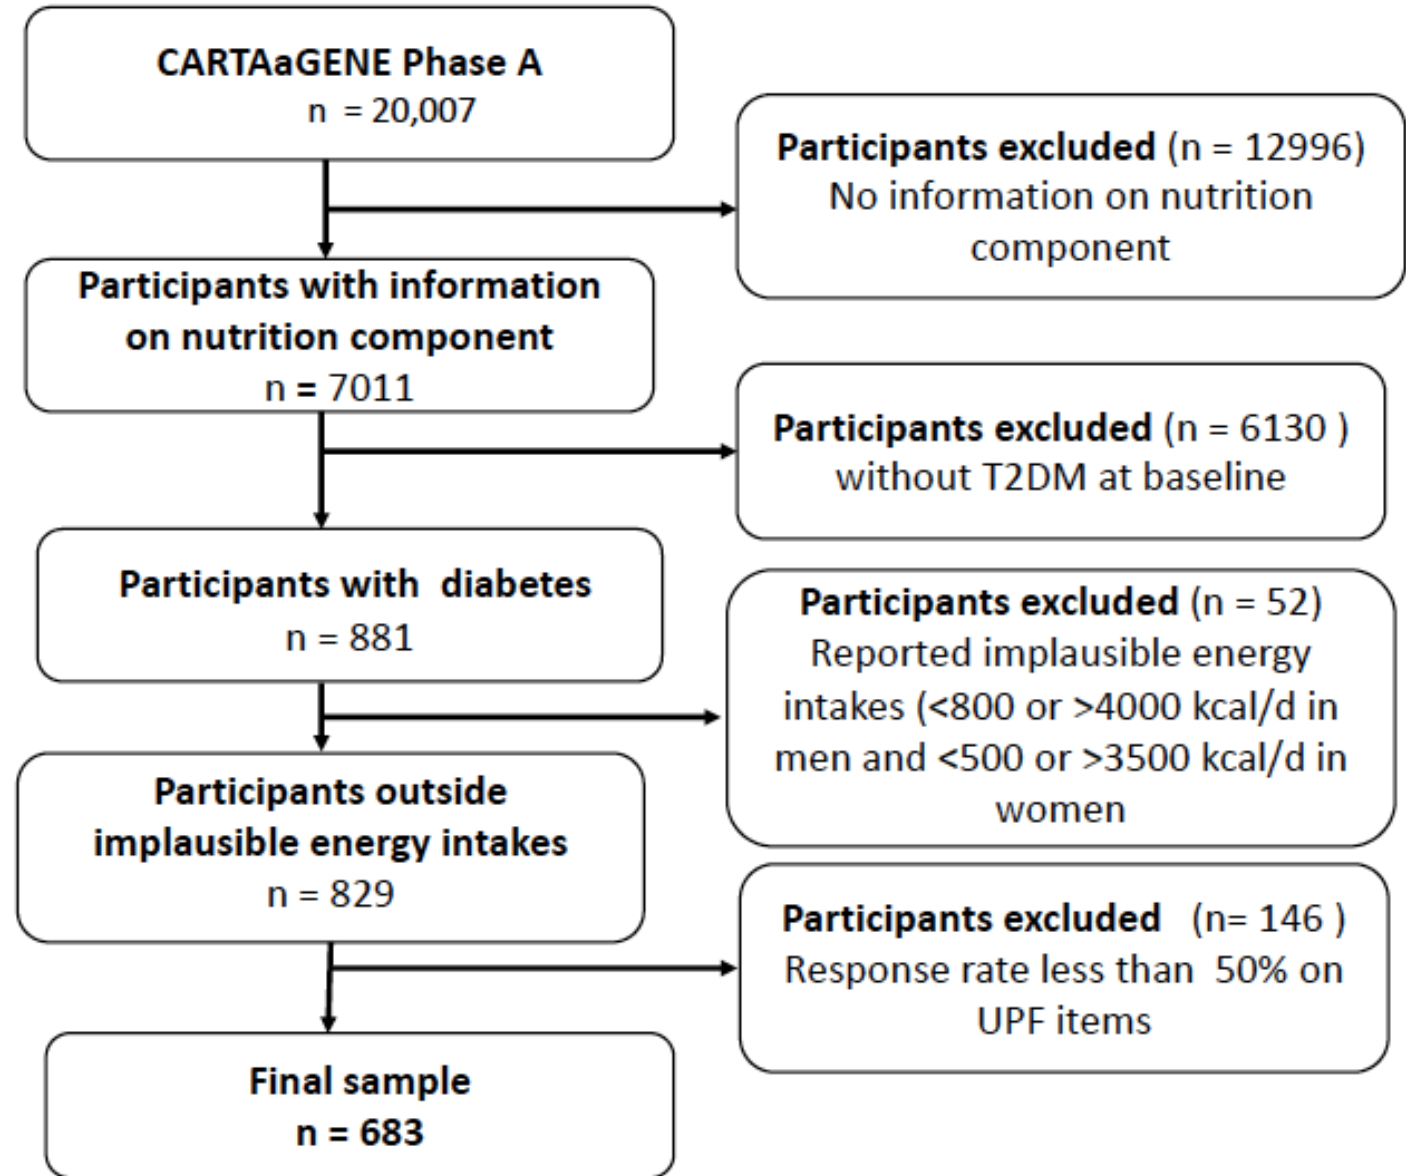

- Diabetic retinopathy
- Nephropathy
- Neuropathy

• **Outcome:** Macrovascular diabetes complications

- Cerebrovascular
- Cardiovascular
- Peripheral vascular disease (PVD)

Inclusion and  
exclusion  
criteria

# Cox proportional hazards

Exposure

- a) Lower/middle tertile of UPF and low depressive symptoms (LUND as the reference group)
- b) Lower/middle tertile of UPF and high depressive symptoms (LUD)

2016

Survival analyses was be performed in unadjusted models and models adjusted for covariates

## Baseline characteristics of the study sample

- The mean age of the sample was 55.5 (SD = 7.5) years
- A total of 105 (15.4%) individuals developed diabetes-related complications
- Participants in the HUD group had a higher mean intake of the UPFs 615.2 (478.2) g/d, and a higher BMI 31.0 (6.2)

Contribution of each food group to total amount of ultra-processed foods consumed in the CARTaGENE study

Forest plot for adjusted hazard ratios for incident type 2 diabetes complications in univariate associations

Forest plot for adjusted hazard ratios for incident type 2 diabetes complications in joint associations

### Model 1

LUD vs LUND 1.39 (0.69 - 2.80)

HUND vs LUND 1.41 (0.88 - 2.25)

HUD vs LUND 2.07 (0.91 - 4.70)

### Model 2

LUDA vs LUNDA 1.30 (1.27 - 2.09)

HUNDA vs LUNDA 1.27 (0.78 - 2.09)

HUDA vs LUNDA 2.59 (1.32 - 5.06)

## Overall conclusion

- ❖ Individuals with co-occurring depression and high UPF consumption may represent a sub-group at risk of T2D and its complications
- ❖ In clinical practice, early management and monitoring of both risk factors might be an important step in the diabetes prevention strategy

## Limitation

- ❖ Food frequency questionnaire
- ❖ Administrative database
- ❖ CARTaGENE respondents were also limited to mostly white participants (93%)

## Research and policy

- ❖ Identifying individuals at higher risk of type 2 diabetes
- ❖ Implementing regulations related to the marketing, advertising, and labeling of UPF
- ❖ Integrated care models that incorporates mental health treatment and addresses behavioral risk factors like UPF consumption
